# Regional Modeling of Atmospheric Deposition with CMAQ as a tool for Ecosystem Based Management

## Organization of Talk:

What is CMAQ

(Community Multiscale Air Quality model)

*How does it perform regionally*

What does N deposition look like across the A-P region

*Species of nitrogen deposition?*

*What are the sources?*

The special case of ammonia

What deposition levels do we expect in 2020 compared to 2002

# Atmospheric Nitrogen Deposition - Eutrophication

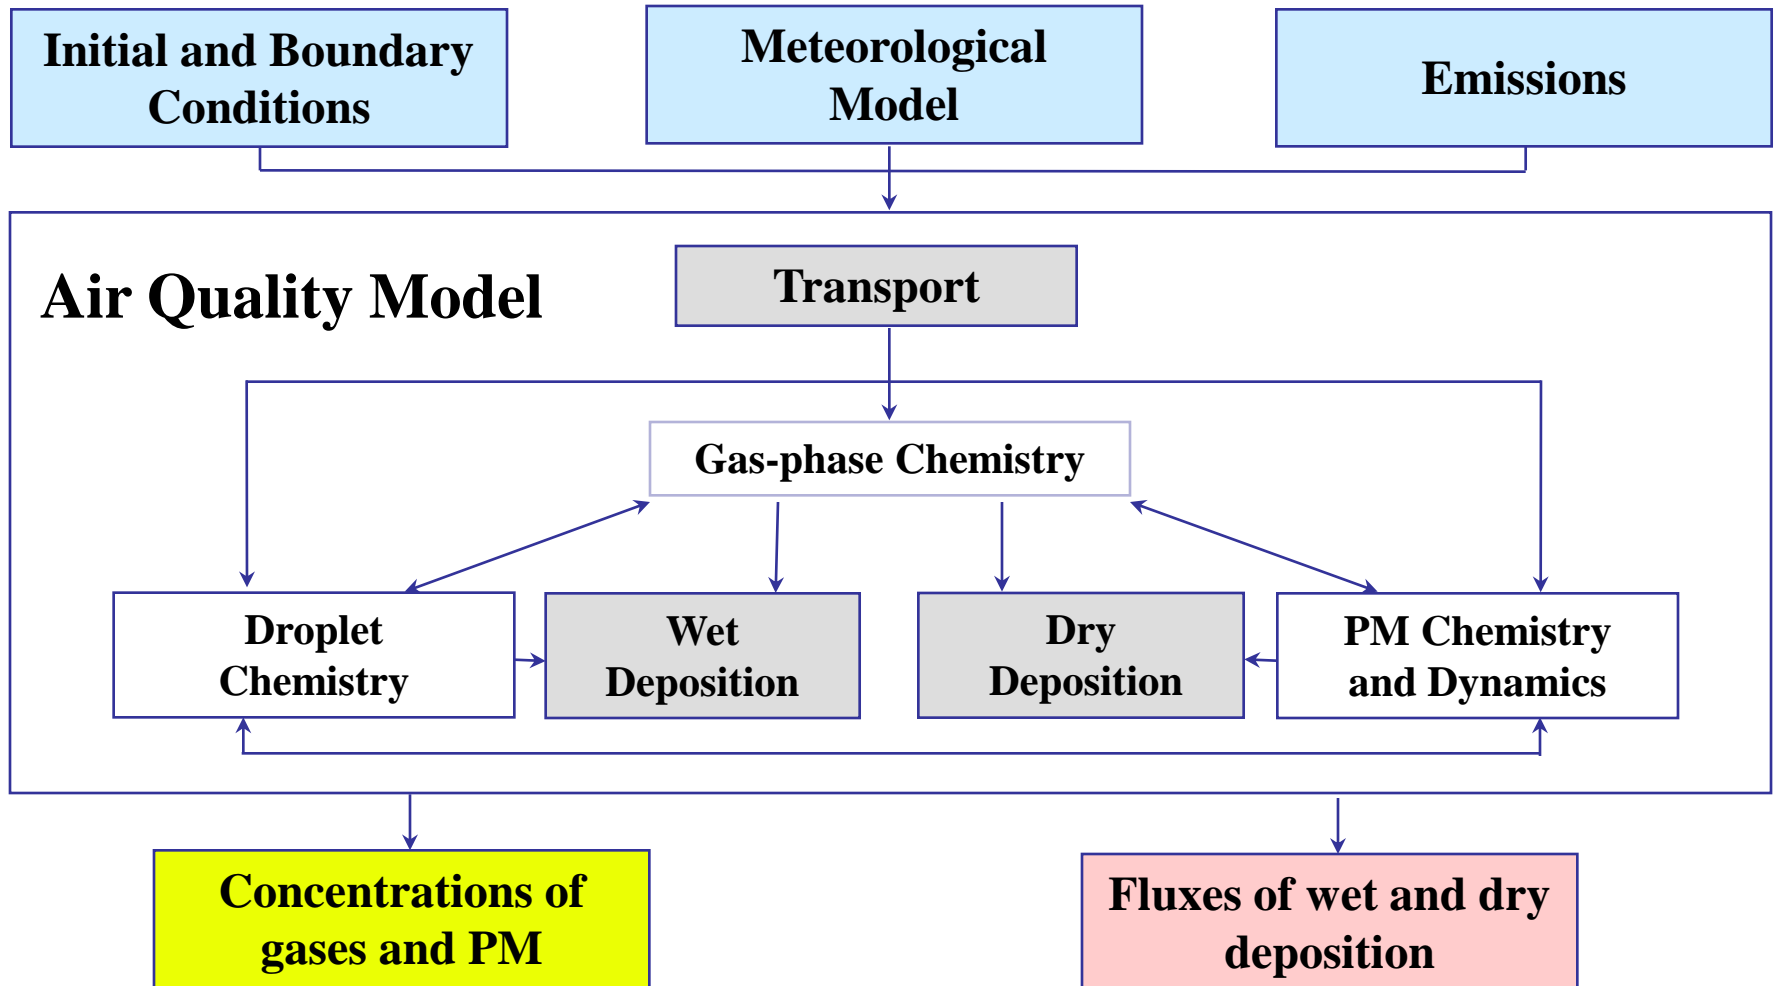

## Nitrogen Loading to Estuaries by Source Type

- Air accounts for 20-35% of N loading to estuaries (both indirect and direct)
- Chesapeake Bay & Neuse: Air accounts for ~30% of N loading
- A regional atmospheric deposition model can provide useful information for Ecosystems Based Management regarding these deposition inputs

# Schematic Representation of the

# Community Multiscale Air Quality (CMAQ) Model

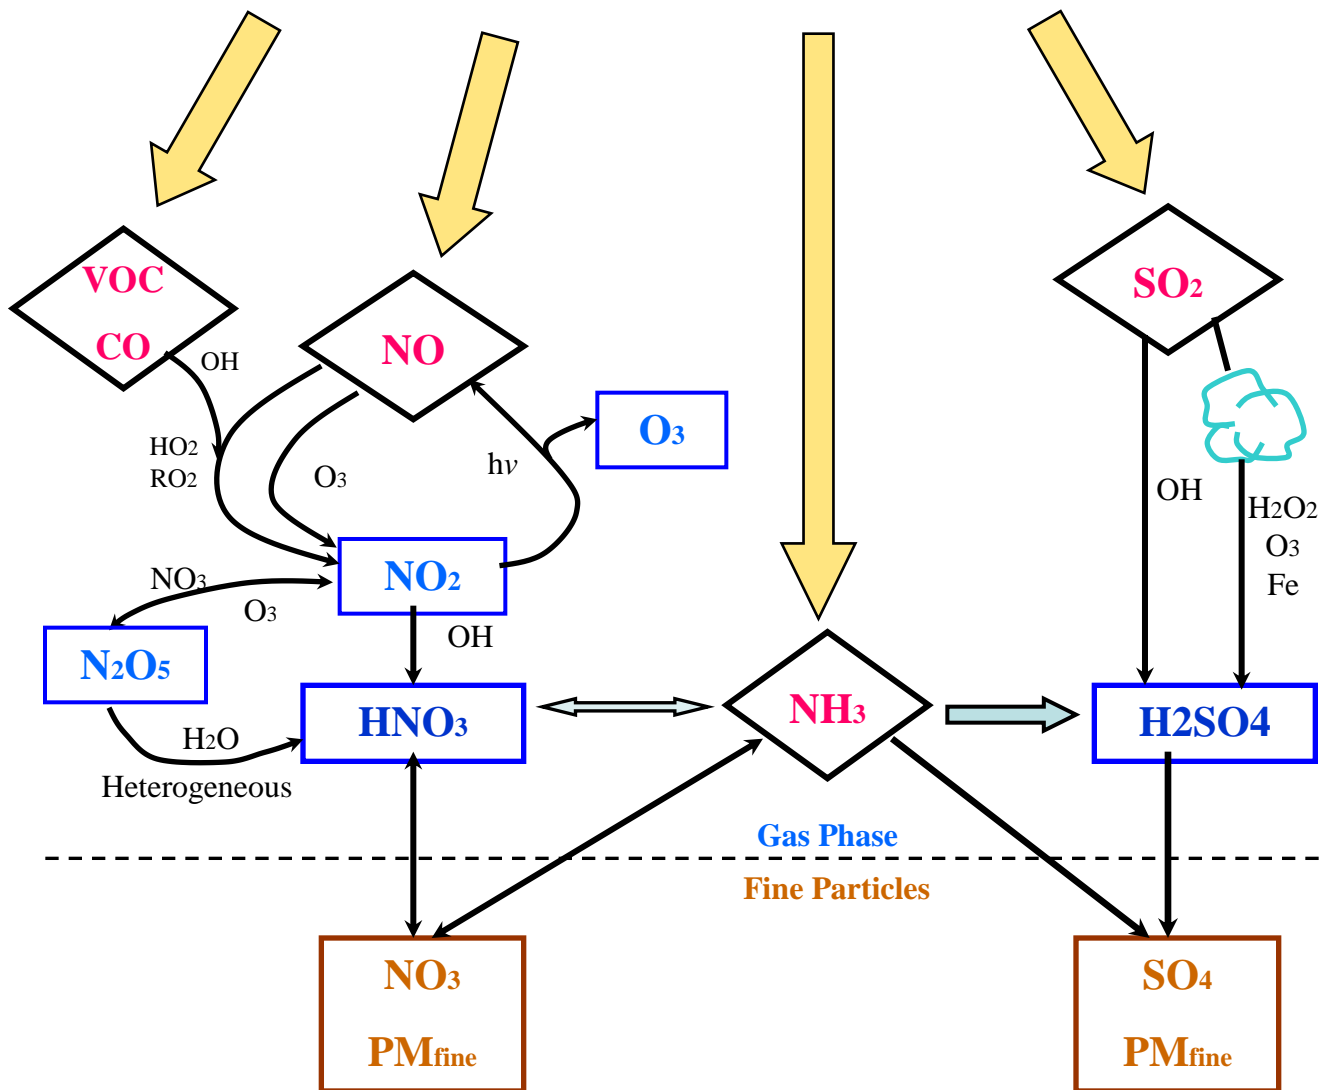

**Stationary Sources,  
Cars, Trucks,  
Power Plants**

**Agricultural  
Sources**

**Power Plants**

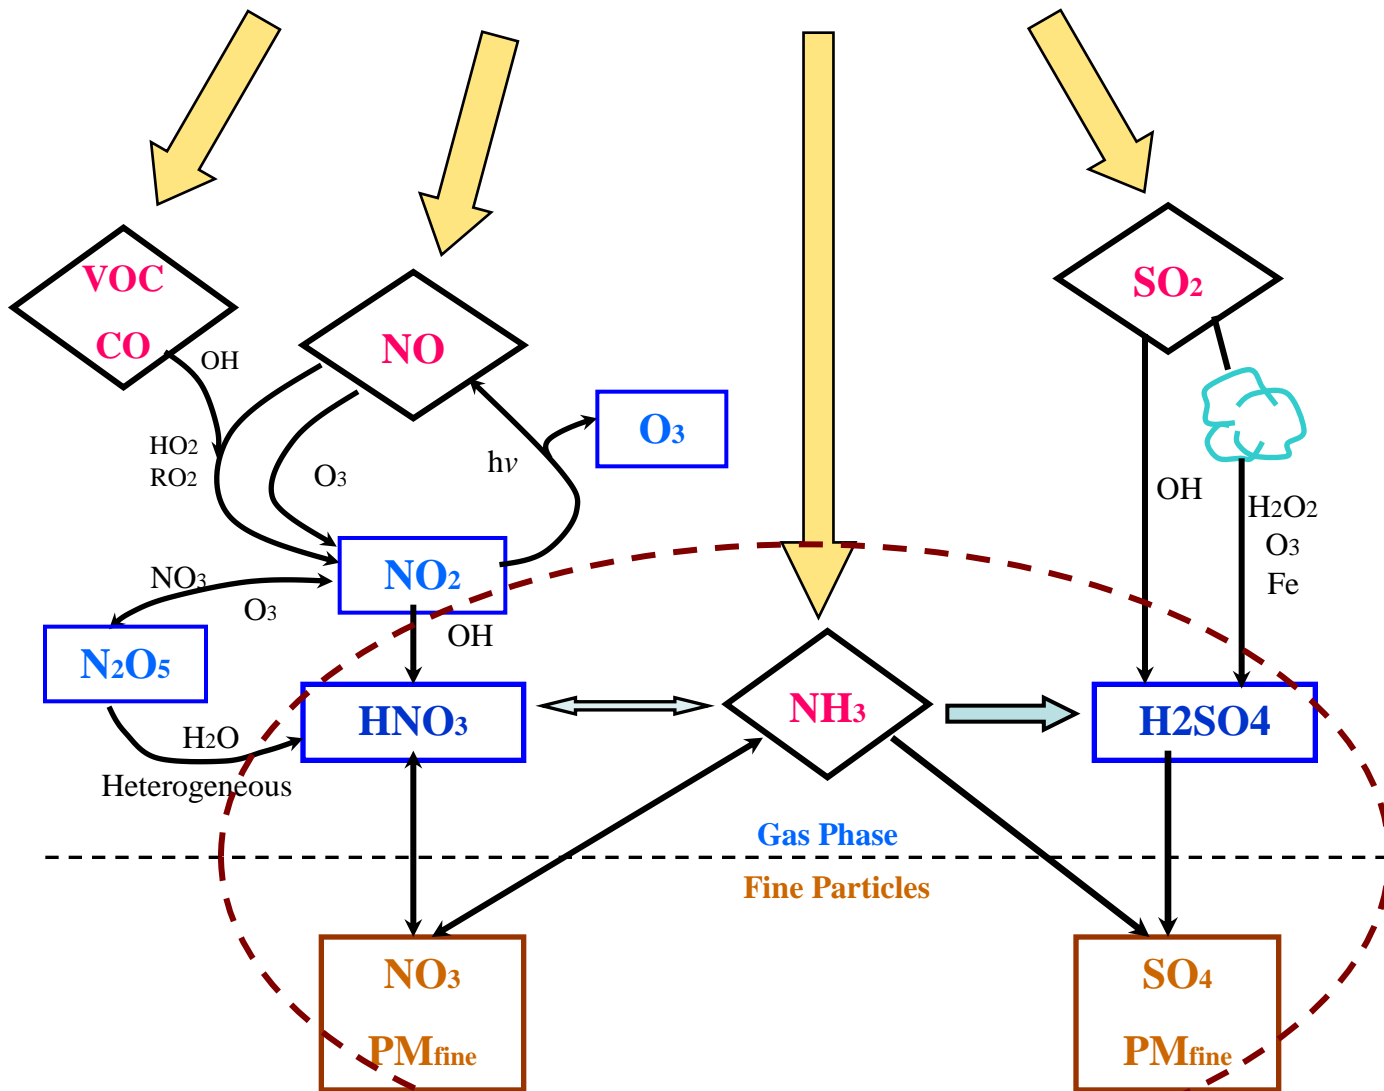

**Fossil Fuel  
Combustion  
that Produces  
Nitrogen and  
Sulfur Oxides  
( $\text{NO}_x$  and  $\text{SO}_x$ )  
and  
Agricultural  
Production  
that Produces  
Ammonia are  
the Main  
Sources of  
Inorganic  $\text{PM}_{2.5}$   
and Nitrogen  
Deposition**

**Stationary Sources,  
Cars, Trucks,  
Power Plants**

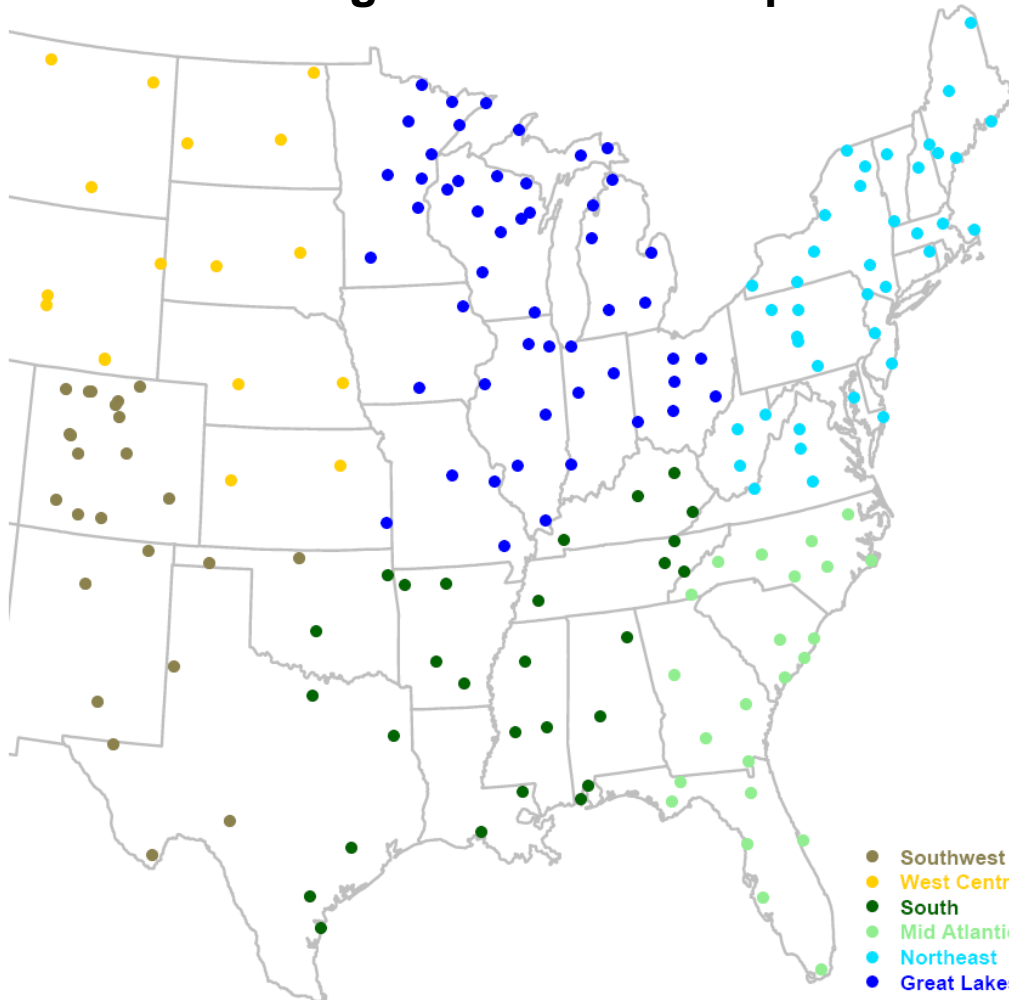

**Agricultural  
Sources**

**Power Plants**

**The Partitioning Between Gases and Particles, Which Is Determined by Ammonia Availability, Greatly Affects Concentrations of aNO<sub>3</sub><sup>-</sup> and aSO<sub>4</sub><sup>=</sup> Which Have Low Rates of Dry Deposition**

## Color coding used for scatter plots

182 NADP monitoring sites

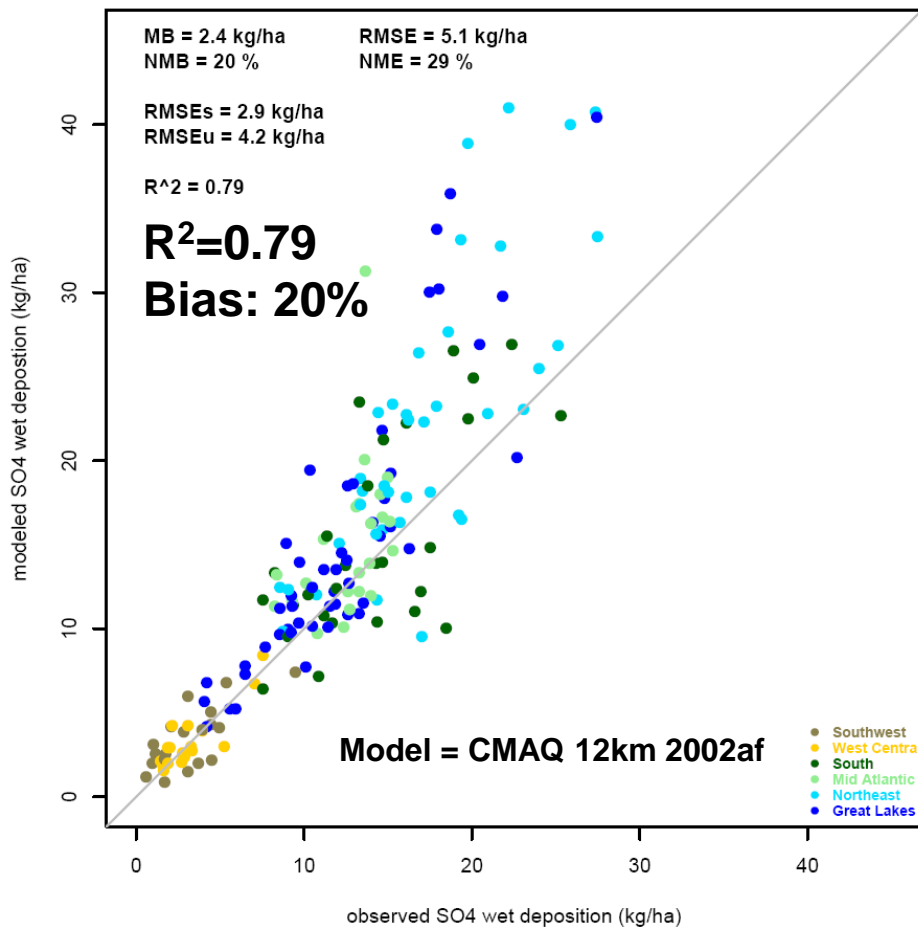

**How well does  
CMAQ perform?**

**Compare model  
wet deposition  
estimates against  
NADP wet  
deposition  
measurements**

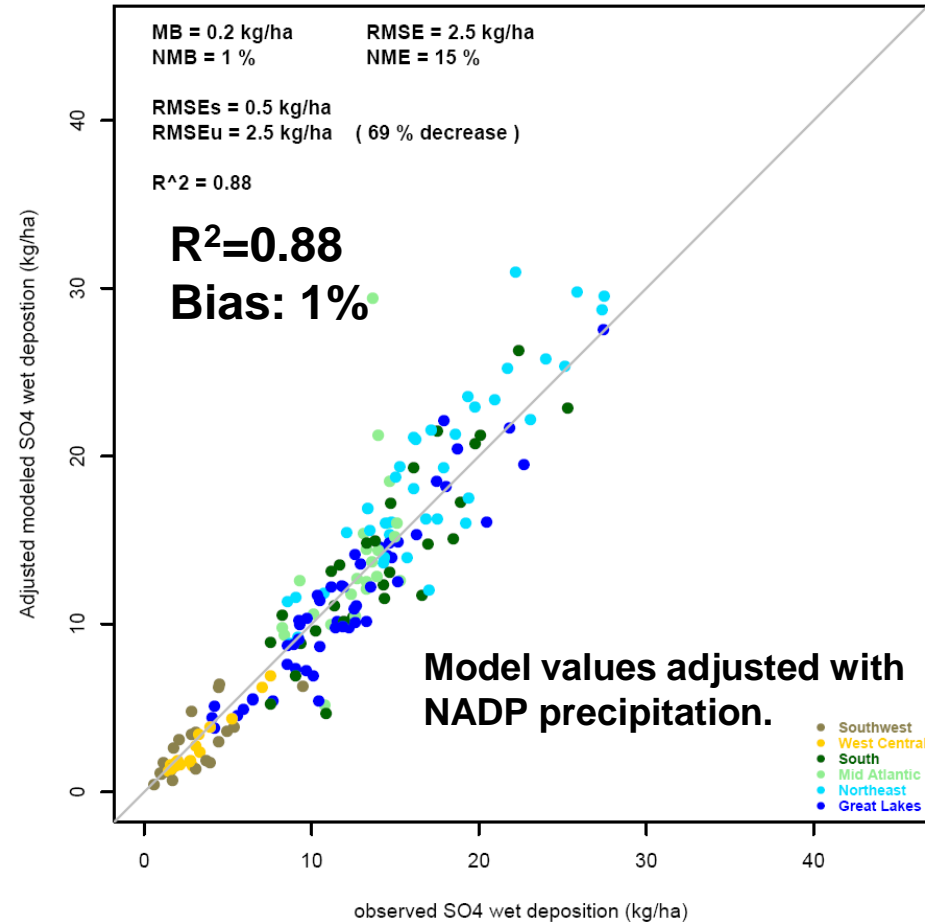

***Correct for  
precipitation error***

# Precipitation-Corrected Wet Deposition SO<sub>4</sub>: Has the least uncertainty

## Observed vs. Modeled Wet Deposition SO<sub>4</sub>

## Observed vs. Adjusted Modeled Wet Deposition SO<sub>4</sub>

**PRISM  
orographic  
enhancements  
are  
evident**

Precipitation Ratio: PRISM / CMAQ

Adjusted CMAQ Wet Deposition  $\text{SO}_4$  (kg/ha)

Model values adjusted with  
PRISM precipitation.

# Precipitation-Corrected Wet Deposition NO<sub>3</sub>: Intermediate uncertainty

## Observed vs. Modeled Wet Deposition NO<sub>3</sub>

## Observed vs. Adjusted Modeled Wet Deposition NO<sub>3</sub>

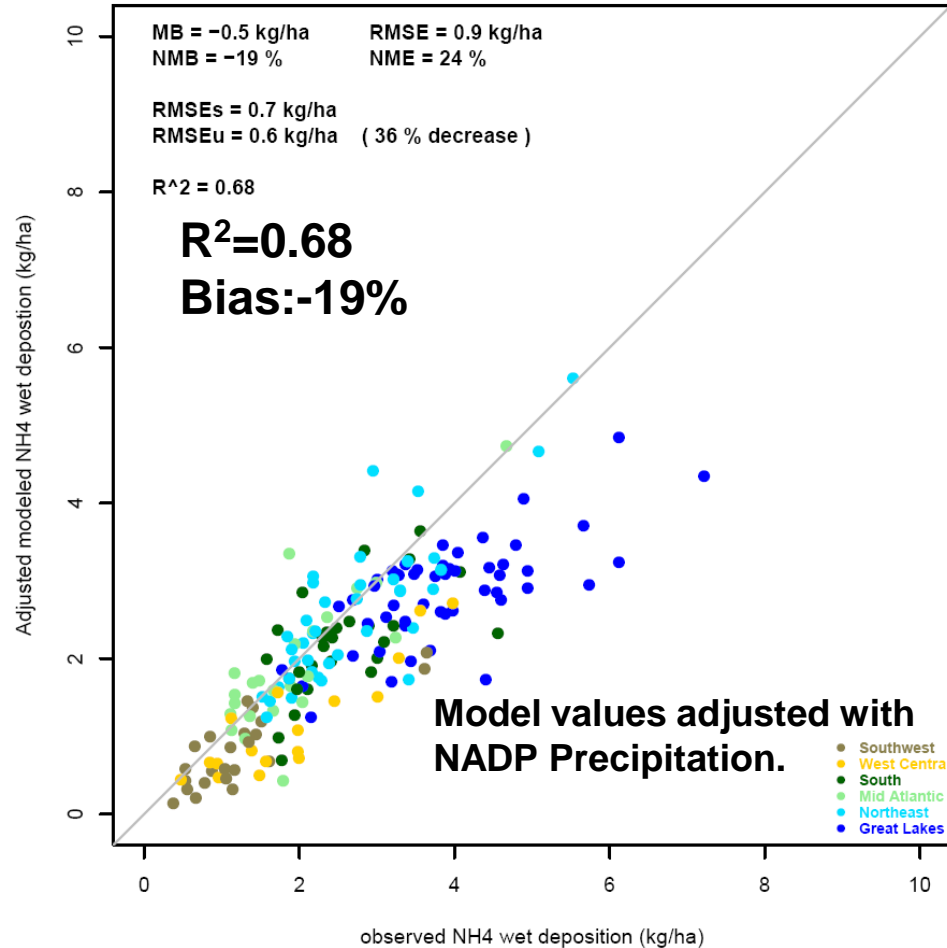

# Precipitation-Corrected Wet Deposition NH<sub>4</sub>: Has the most uncertainty

## Observed vs. Modeled Wet Deposition NH<sub>4</sub>

## Observed vs. Adjusted Modeled Wet Deposition NH<sub>4</sub>

# Resultant Wet Deposition Fields for $\text{NO}_3$ and $\text{NH}_4$

### Adjusted CMAQ Wet Deposition $\text{NO}_3$ (kg/ha)

Model values adjusted with PRISM precipitation and then bias adjusted.

### Adjusted CMAQ Wet Deposition $\text{NH}_4$ (kg/ha)

Model values adjusted with PRISM precipitation and then bias adjusted.

# CMAQ is able to capture local concentration gradients of key species in NC (2004 data)

## High Ammonia Site in Sampson County, NC (12-Hr)

**Ammonia**

45  $\mu\text{g}/\text{m}^3$  →

**Sulfate**

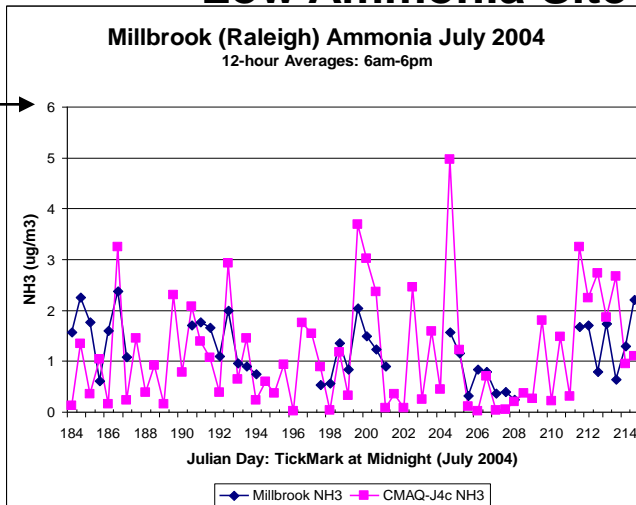

20  $\mu\text{g}/\text{m}^3$

## Low Ammonia Site in Raleigh, NC (12-Hr)

**Ammonia**

6  $\mu\text{g}/\text{m}^3$  →

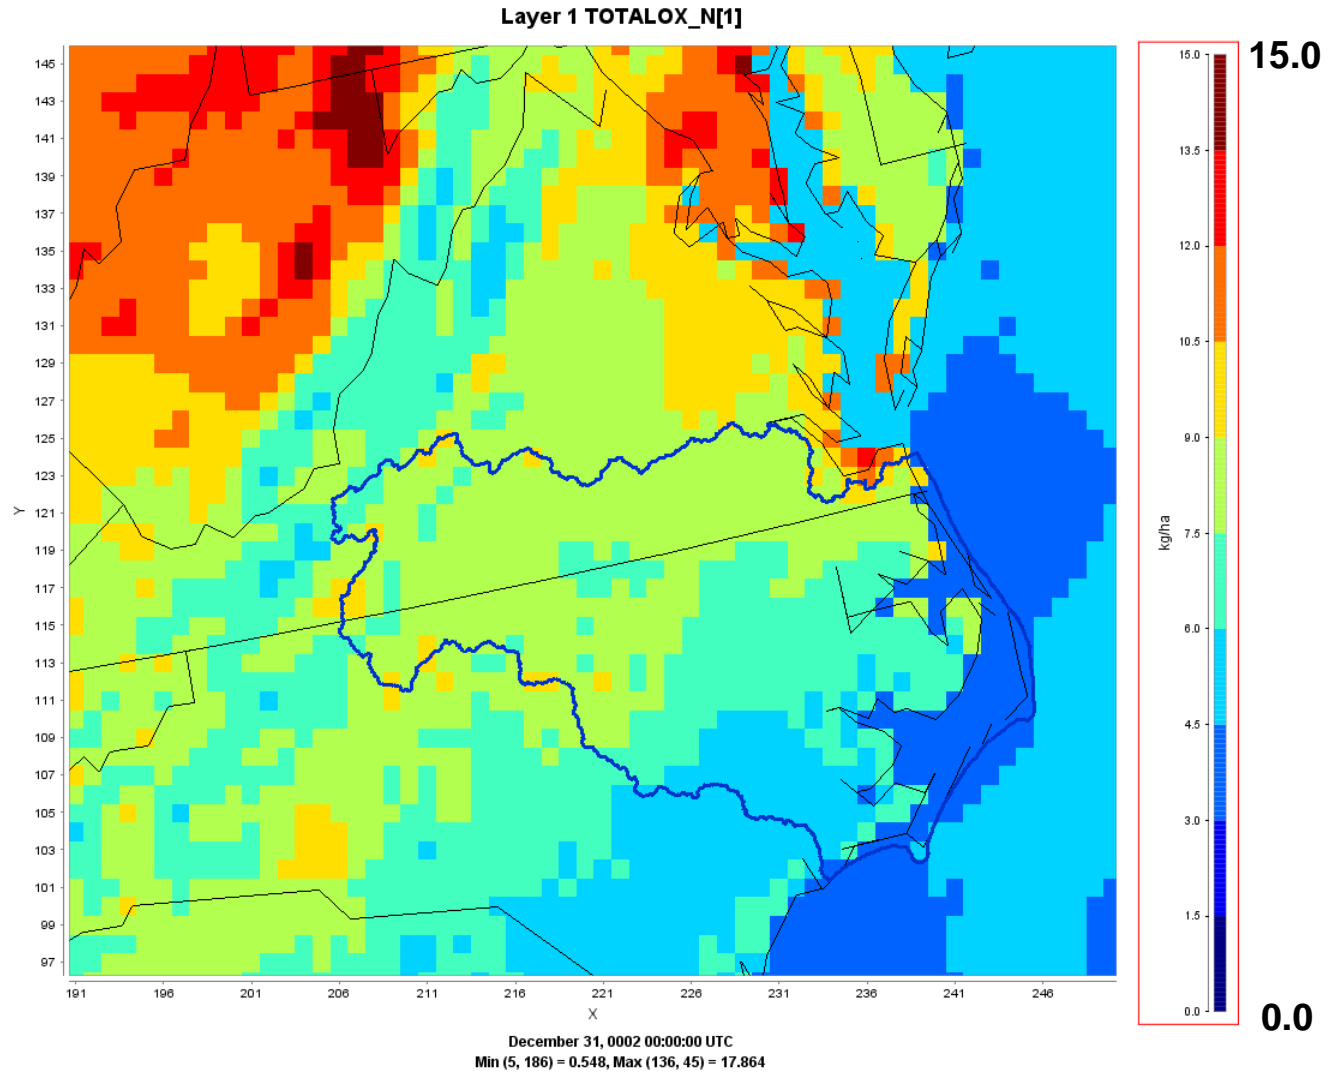

**Sulfate**

20  $\mu\text{g}/\text{m}^3$

# What does the deposition look like across The A-P region: 2002 Total oxidized-N

# What does the deposition look like across The A-P region: 2002 Total oxidized-N

Layer 1 TOTALOX\_N[1]

With Watershed Tool we  
can map CMAQ 12-km  
results to 12-digit HUCs

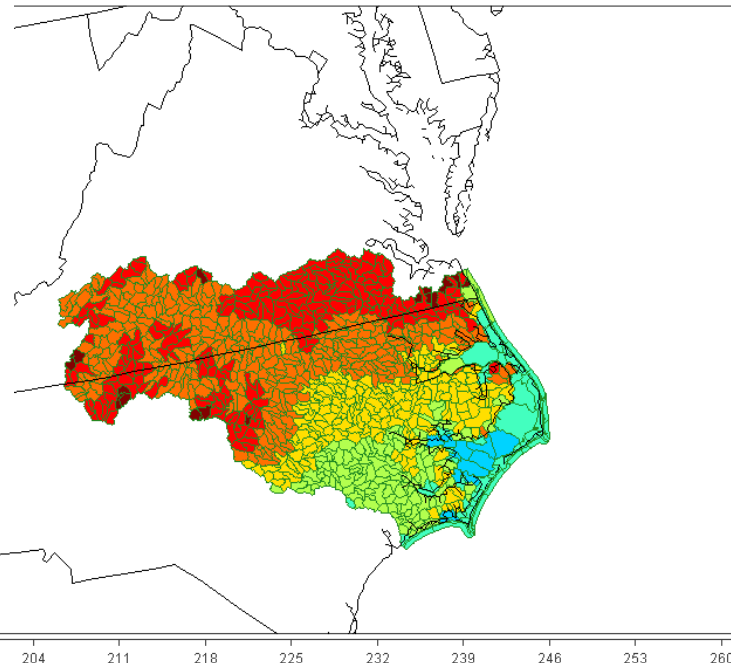

*Note Scale Change*

Layer 1 TOTALOX\_N[1]

kg/ha

December 31, 0002 00:00:00 UTC  
Min (5, 186) = 0.548, Max (136, 45) = 17.864

December 31, 2 00:00:00 UTC  
Min (260, 95) = 2.9, Max (207, 145) = 15.3

# What does the deposition look like across The A-P region: 2002 Total reduced-N

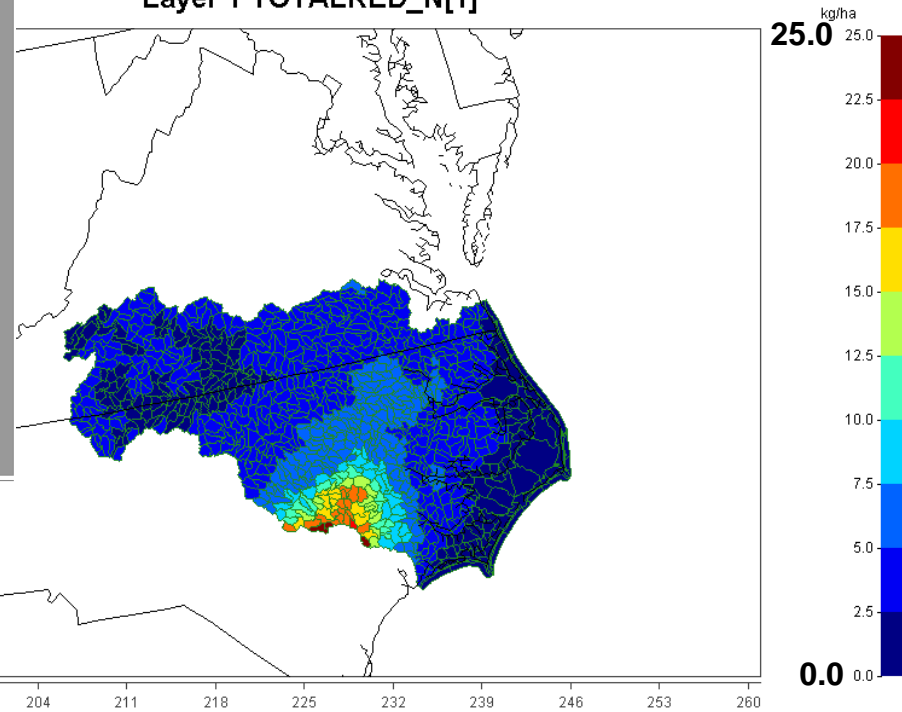

Layer 1 TOTALRED\_N[1]

December 31, 0002 00:00:00 UTC  
Min (257, 1) = 0.075, Max (133, 47) = 62.412

With Watershed Tool we  
can map CMAQ 12-km  
results to 12-digit HUCS

Layer 1 TOTALRED\_N[1]

December 31, 2000:00:00 UTC  
Min (260, 96) = 0.7, Max (226, 105) = 36.4

# What does the deposition look like across The A-P region: 2002 Total N

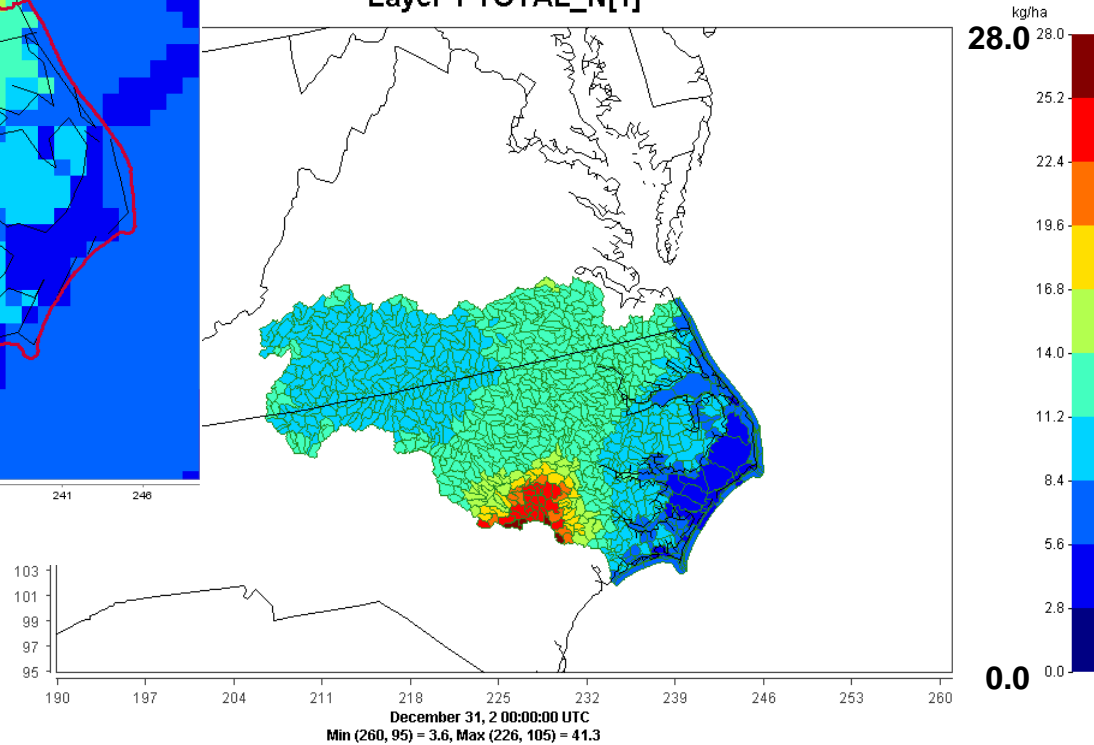

Layer 1 TOTAL\_N[1]

December 31, 0002 00:00:00 UTC  
Min (267, 1) = 0.754, Max (133, 47) = 70.944

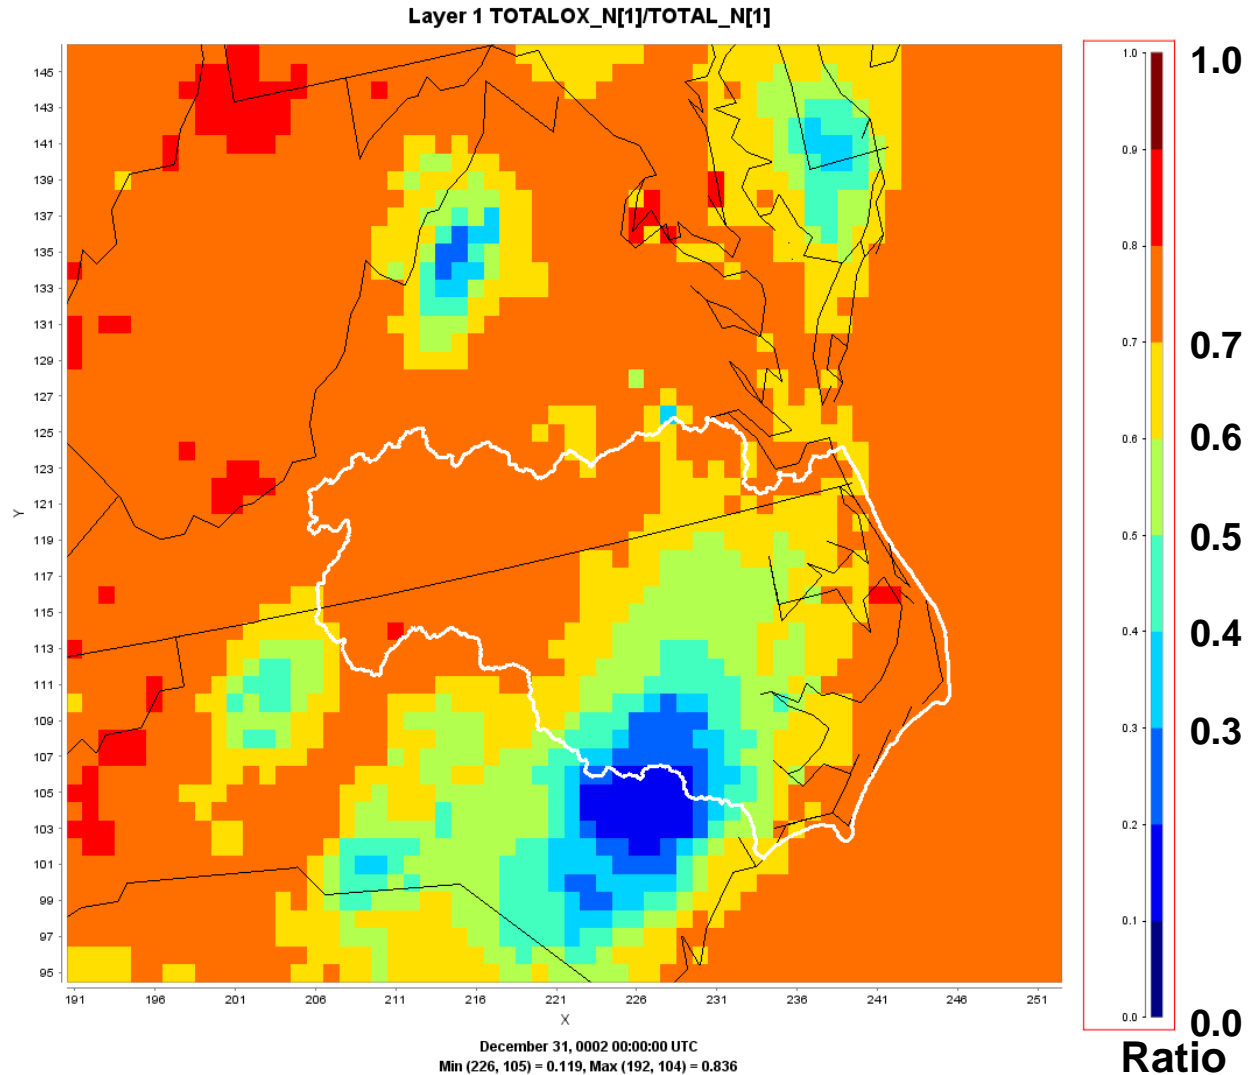

With Watershed Tool we  
can map CMAQ 12-km  
results to 12-digit HUCS

Layer 1 TOTAL\_N[1]

December 31, 2 00:00:00 UTC  
Min (260, 95) = 3.6, Max (226, 105) = 41.3

# Where is the relative contribution of ox-N deposition to total N deposition important across the A-P region: It's in the headwaters

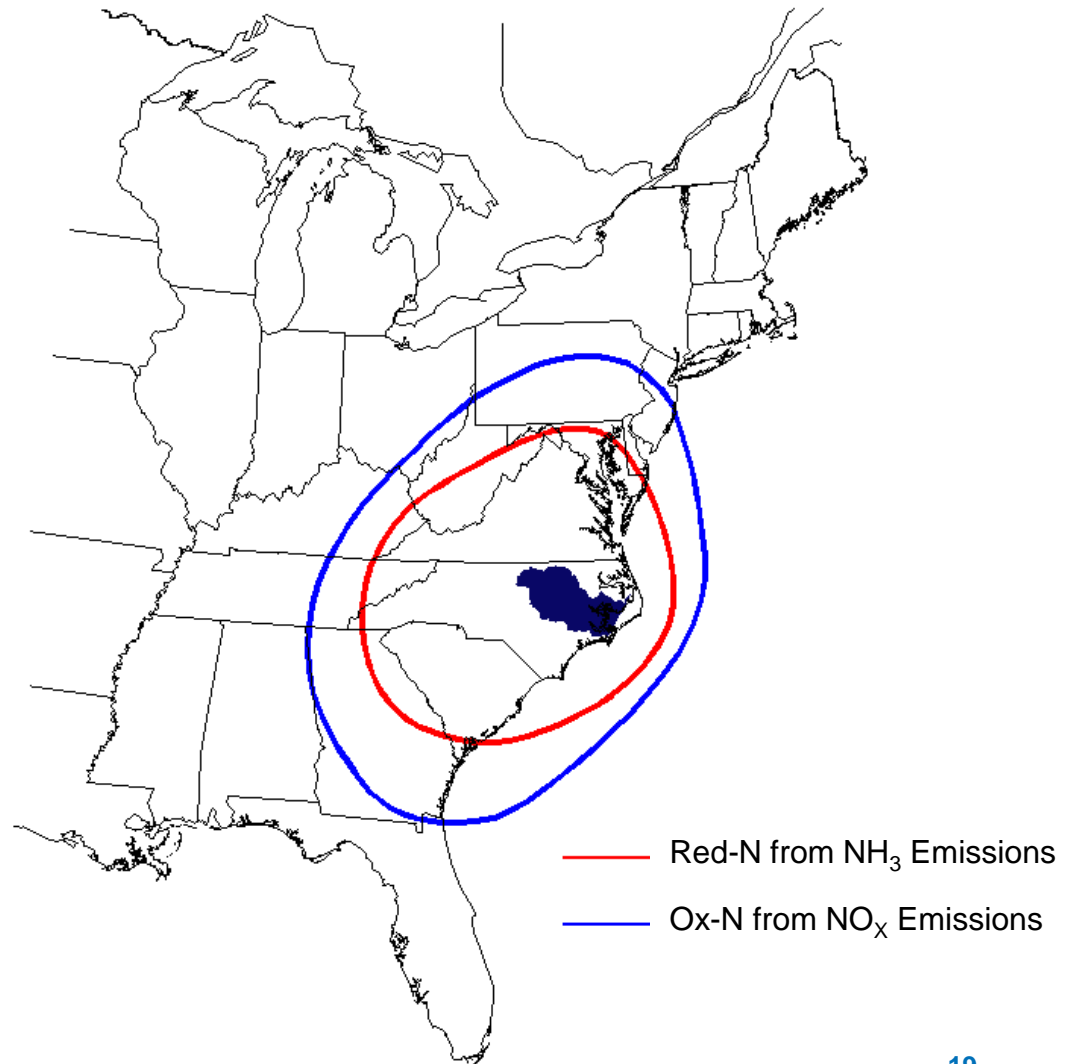

# Where is the Nitrogen Coming From?

## PRINCIPAL NITROGEN AIRSHEDS FOR: PAMLICO SOUND

The emissions that contribute most to the deposition in the A-P region come from many states, not only NC

Any action to reduce atmospheric deposition to the A-P region will require regional, multi-state reductions in  $\text{NO}_x$  and  $\text{NH}_3$  emissions

# Oxidized Nitrogen Deposition State Responsibility

Deposition to Chesapeake Bay Watershed		
	1990	2020
Delaware		1.2%
Maryland	9.1%	7.9%
New York		4.6%
Pennsylvania	16.8%	16.4%
Virginia	10.4%	14.9%
West Virginia		4.6%
Six State (calculated as a group)		49.3%

PRINCIPAL NITROGEN AIRSHEDS FOR:  
CHESAPEAKE BAY

# What Sectors are Responsible For the Nitrogen Emissions

	2002 NO <sub>x</sub> Emissions in NO <sub>x</sub> Airshed (8 States) % by Sector	2002 NH <sub>3</sub> Emissions in NH <sub>3</sub> Airshed (4 States) % by Sector
Mobile	38.5 %	8.9 %
NonRoad	14.4 %	0.1 %
Power Plants	28.0 %	0.3 %
Industrial Points	10.3 %	2.3 %
Area Sources	6.3 %	0.9 %
Agriculture/Biology	1.8%	86.8 %
Other	0.71 %	0.6 %

Mobile + Power Plant sources responsible for 2/3<sup>rds</sup> of NO<sub>x</sub> emissions

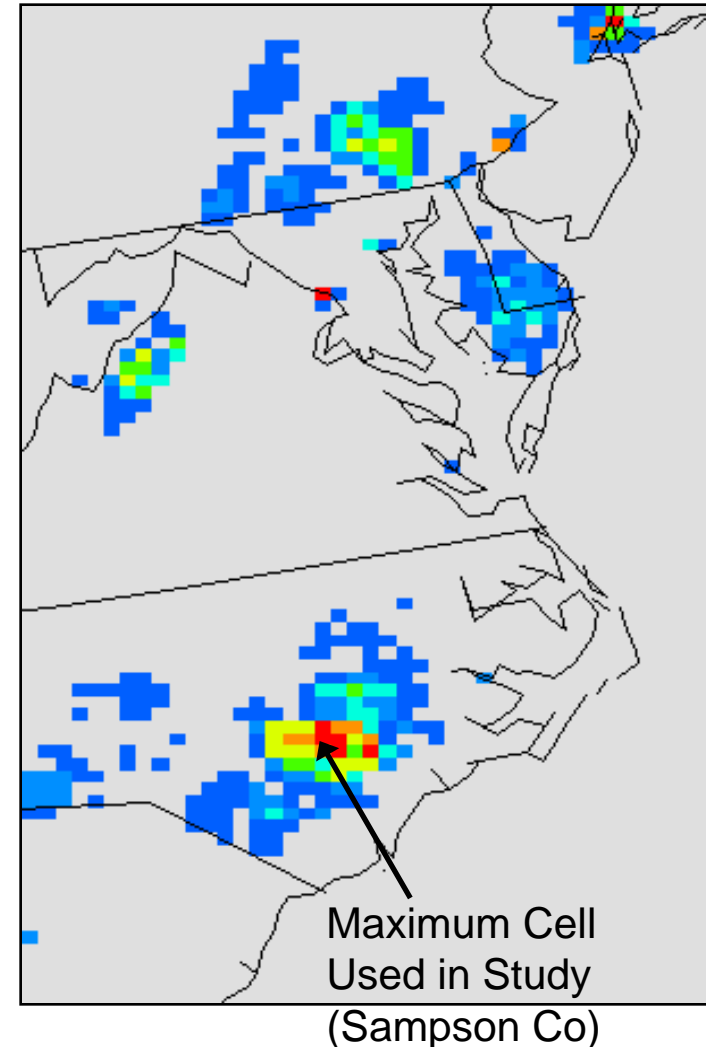

# What States are Responsible For the Nitrogen Emissions

	2002 NO <sub>x</sub> Emissions in NO <sub>x</sub> Airshed (8 States) % by State
Delaware	1.6 %
Georgia	18.6 %
Maryland	8.3 %
North Carolina	17.3 %
Pennsylvania	21.7 %
South Carolina	10.2%
Virginia	14.5 %
West Virginia	7.7 %

	2002 NO <sub>x</sub> Emissions in NH <sub>3</sub> Airshed (4 States) % by State	2002 NH <sub>3</sub> Emissions in NH <sub>3</sub> Airshed (4 States) % by State
Maryland	16.6 %	10.7 %
North Carolina	34.4 %	57.4 %
South Carolina	20.2 %	12.4 %
Virginia	28.8 %	19.5 %

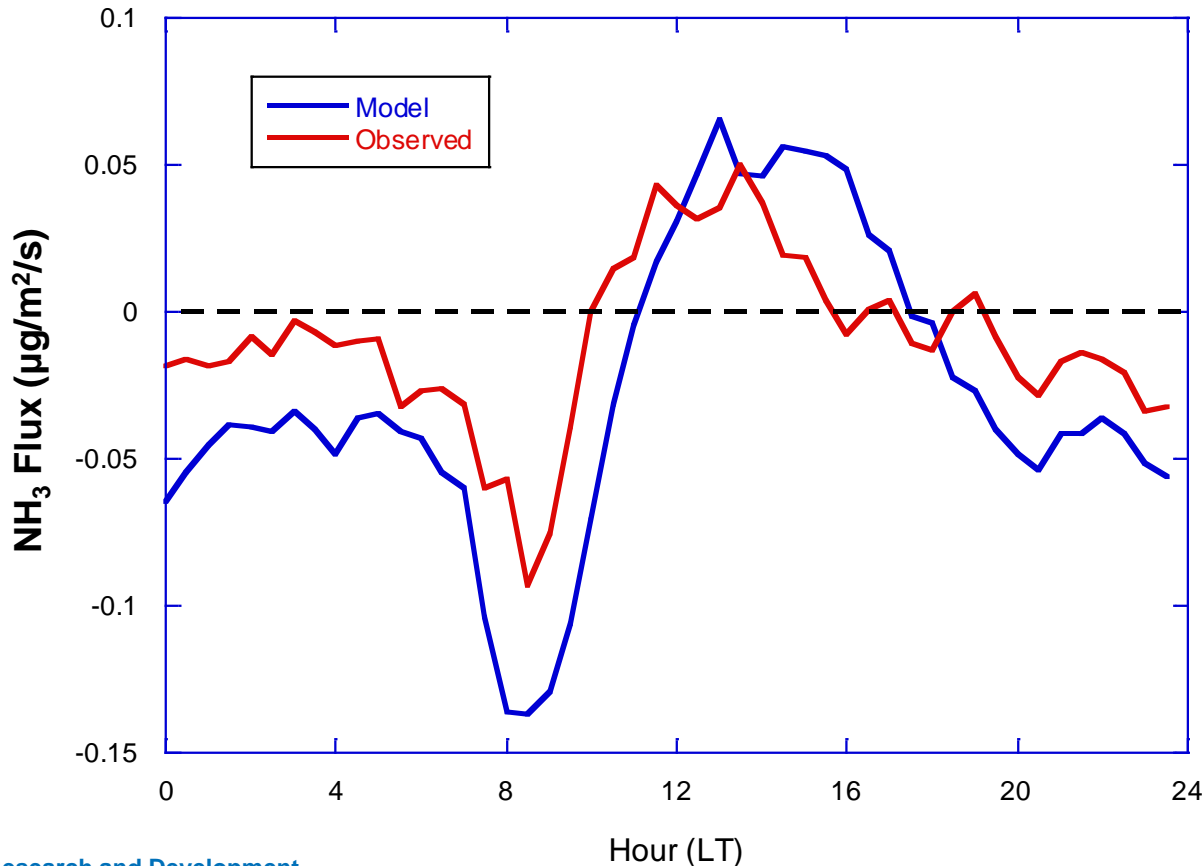

# A Special Look at Ammonia

- Ammonia is important and there is a conventional wisdom among some that all ammonia emissions deposit very near the point of emission, i.e. locally.
- This is incorrect. We have conducted some model  $\text{NH}_3$  budget studies for NC conditions to estimate the appropriate  $\text{NH}_3$  fate (according to CMAQ). The CMAQ results are very consistent with semi-empirical studies carried out in NC by John Walker (EPA) and Wayne Robarge (NCSU).
- We particularly examined:
  - The budget of a high-emitting cell at the surface, and
  - The range of influence of the emissions from a single, high-emitting cell

**Ammonia is also more complex than most species because its air-surface exchange is bi-directional, not unidirectional. So we performed our NH<sub>3</sub> budget studies with three different estimates of the rate of air-surface exchange**

**Summer average ammonia flux over soybeans in Eastern NC - 2002**

# Only about 10% of the Local NH<sub>3</sub> Emissions Deposit Locally (consistent with semi-empirical studies)

June 2002

# Range of Influence: Single NC Maximum Cell

The Range of Influence of  $\text{NH}_3$  Emissions is Influenced by the Dry Deposition Formulation. It Increases With a Change from the Base CMAQ to the Bi-directional Flux Formulation for  $\text{NH}_3$

# What is Expected to Happen to Deposition In the Future out to 2020

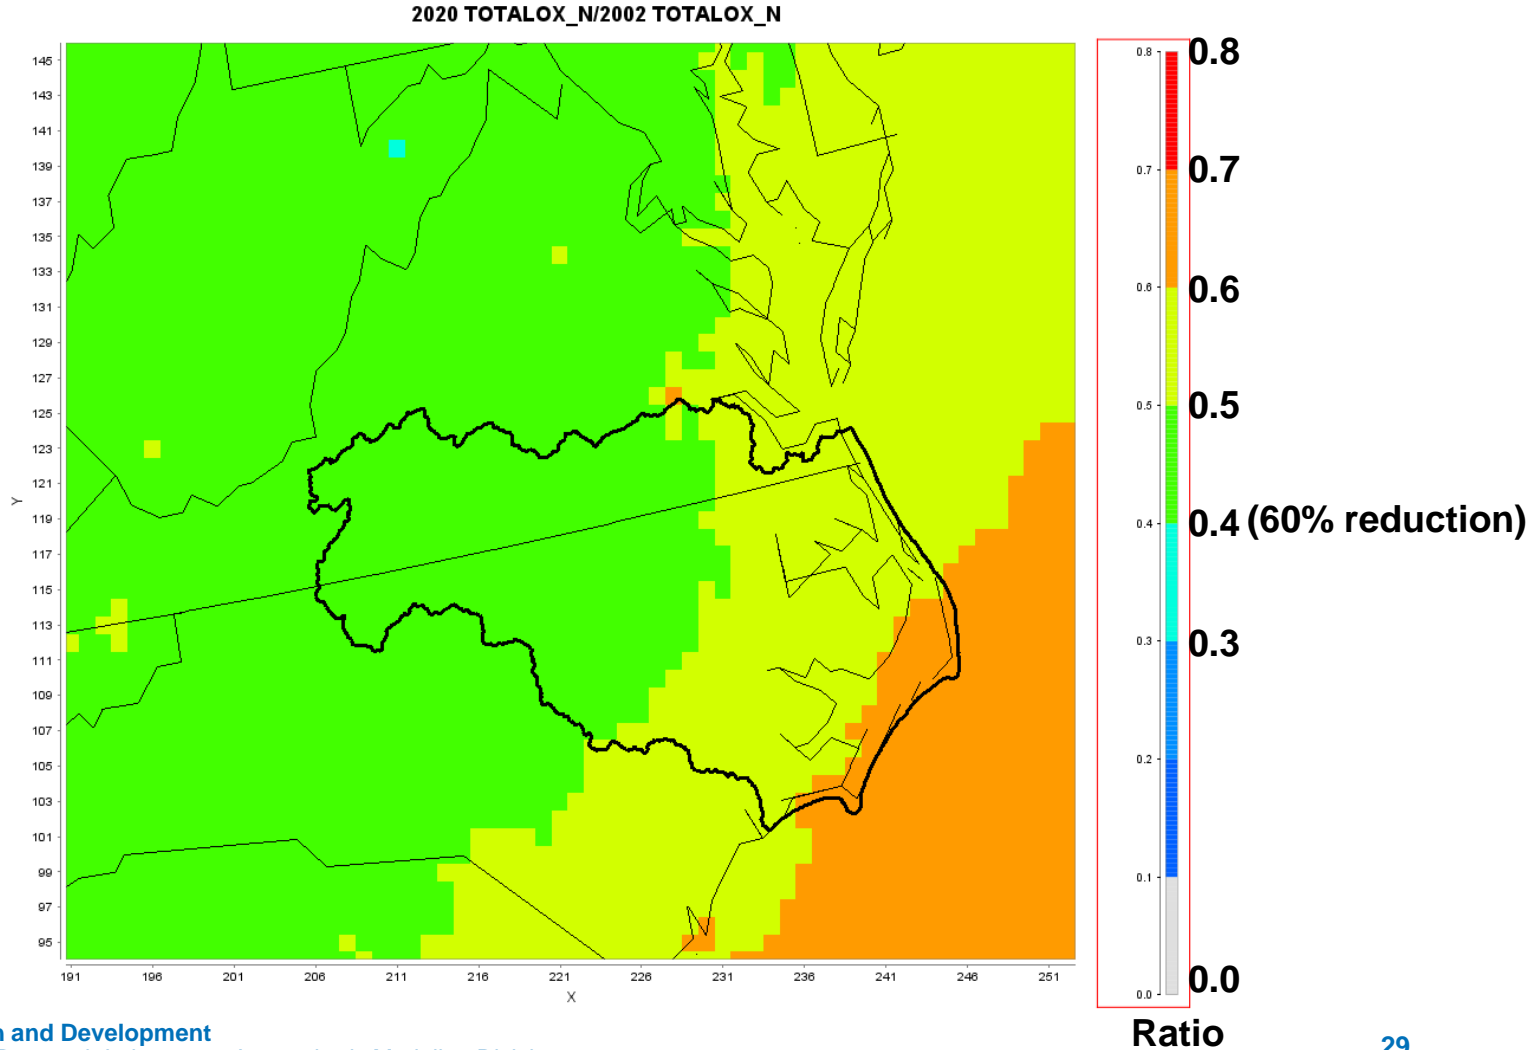

# Does Responsibility for Oxidized Nitrogen Emissions Change in 2020 With CAA Reductions

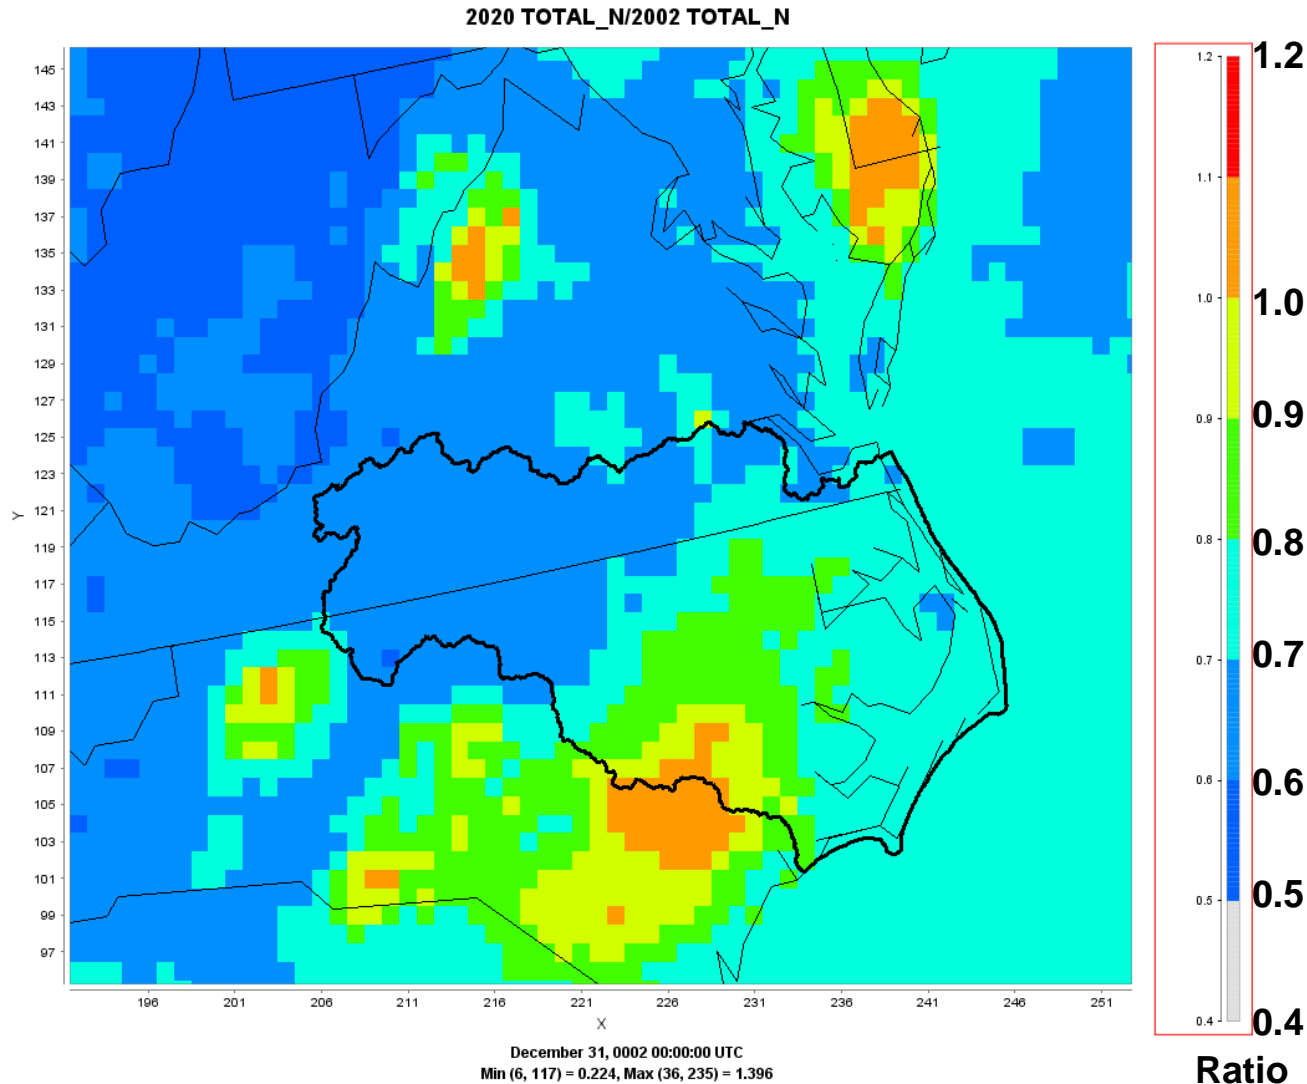

Sectors	2002 NO <sub>x</sub> Emissions in NO <sub>x</sub> Airshed (8 States) % by Sector	2020 NO <sub>x</sub> Emissions in NO <sub>x</sub> Airshed (8 States) % by Sector
Mobile	38.5 %	20.7 %
NonRoad	14.4 %	18.7 %
Power Plants	28.0 %	21.9 %
Industrial Points	10.3 %	18.6 %
Area Sources	6.3 %	14.3 %
Biogenics	1.8%	4.2 %
Other	0.71 %	1.6 %

States	2002 NO <sub>x</sub> Emissions in NO <sub>x</sub> Airshed (8 States) % by State	2020 NO <sub>x</sub> Emissions in NO <sub>x</sub> Airshed (8 States) % by State
Delaware	1.6 %	1.8 %
Georgia	18.6 %	19.3 %
Maryland	8.3 %	7.5 %
North Carolina	17.3 %	15.3 %
Pennsylvania	21.7 %	21.4 %
South Carolina	10.2%	10.0%
Virginia	14.5 %	15.9 %
West Virginia	7.7 %	8.6 %

# The emissions reductions stemming from CAA regulations aimed at reducing human health risk are expected to significantly reduce oxidized nitrogen deposition by 2020

# The 2020 reduction in total nitrogen deposition is much less than the ox-N reduction due to lack of change or increases in red-N deposition

- Regional atmospheric deposition models, like CMAQ, can provide useful information for ecosystem based management (EBM) related to the questions of how much, what form, and where from
- To fully realize the potential to contribute to EBM the air models need to be linked with ecosystem / watershed / biogeochemical cycling models. This is not a trivial exercise and we are working on the linkage issues
- We are also working on approaches to downscale meteorology for climate change analyses in ways to support the study of the impacts on ecosystems
